Application Background

- Instanine is a social application similar to Instagram. The only feature that differentiates this from the Instagram is that the user would be able to merge photos with the pictures captured by their followers or by the one which they follow.

Technology used

- iOSurface
- Xcode 6.3
- Objective C

Application Details

The Problem

The main challenge faced by 200OK Solutions was with the merge photos feature. Also, an auto delete feature was set which enables the shared pictures to get deleted automatically after every 24 hours. We worked on an existing code, which was developed by another offshore company and client didn't like it, hence chose 200OK Solutions for further enhancements of this app.

The Solution

- 200OK Solutions had suggested the iOSurface API for the most challenging merge photos feature.
- The self-clean up feature, where the shared photos gets deleted automatically, was suggested as a solution from 200OK which the client readily agreed.
- Like and dislike feature resembles the "Tinder" application where you can swipe "left" for disliking and towards the "right" for liking.
